Table Notes

- ⁺ Sodium intake estimates include sodium in food and water. Sodium estimates include sodium that occurs naturally in foods, added during processing, and added during cooking. The estimates exclude sodium from discretionary salt added at the table and contributed by dietary supplements and medications. Sodium intake estimates include sodium in drinking water. In 2005-2006, respondents reported drinking water during the 24-hour dietary recall. In 2003-2004, respondents did not report drinking water during the 24-hour dietary recall but reported it in a single question following the 24-hour dietary recall. Drinking water intake data for each of the two-year releases were combined to estimate sodium intake from drinking water.
- [#] The method used to estimate the usual nutrient intake distributions presented in this table was developed by the National Cancer Institute (NCI). An overview of the general method and the procedure for usual intake estimation is available from: [What We Eat in America, NHANES 2005-2006: Usual Nutrient Intakes from Food and Water Compared to 1997 Dietary Reference Intakes for Vitamin D, Calcium, Phosphorus, and Magnesium](#). See Appendix C, Procedure for Usual Intake Estimation.
- [†] Institute of Medicine, Food and Nutrition Board. 2005. Dietary Reference Intakes for Water, Potassium, Sodium, Chloride, and Sulfate. National Academies Press. Washington, DC.
- ^{*} Daily mean and standard error of the mean for sodium are estimated directly from day 1 intake data and do not reflect the NCI usual intake estimation approach used to estimate the distribution statistics. The conventional mean estimates are provided to be comparable to other tables produced by the Food Surveys Research Group. While the NCI method and the conventional method are both estimating the mean, the actual results may differ slightly.
- ^{**} Percentile of usual intake as well as the estimates of percentages less than or greater than the DRI and the standard error of the percentage are the direct result of an estimation of the usual nutrient intake distribution for that specific gender/age/lifestage group. Exceptions were necessary for composite groups where the DRI value differs across the component groups including 19 and over, 51 and over, and 71 and over for males and for females, 19-50 pregnant females, and for males and females 1 and over. For these composite groups, the estimated percentage less than or greater than the DRI value was computed as an average of the percentages for the gender/age/lifestage subgroups comprising the composite group weighted proportionally by population size. Because a single DRI value for these composite groups does not exist, a hyphen is displayed.
- >97** Percentages greater than 97 percent are represented by >97. Standard errors are not displayed in these cases.
